

Most of the tickets were completed at the end and there is a pretty steep descent close to the deadline. One of the causes for this issue was some of the tasks were blocked by other more important tasks and needed to be put on hold until completed. As tasks were being completed other issues began to occur such as merge conflicts on branches, this is one of the reasons why there are a few days where there was no action at all. Another reason for why some of the initial drops were so steep was because the weight of the tasks was greater, each individual task weighed more and so did the subtasks resulting in a steep drop when they were closed. Another thing to note is that as time got closer a greater number of tasks were being completed, this is partly because the blocked tasks were finally able to be resolved. Since a lot of the tasks had intersections once a good chunk of the problems were resolved it was possible to close a lot of the tickets.
